

# Agrinavia MAP

**AGRINAVIA MAP is designed specially for agricultural purposes and is optimized to work with high-resolution Orto photos.**

## FACILITIES IN AGRINAVIA MAP

- Take your field map program with you into the field - on your PDA
- Export graduated lime requirement files
- Plot other informations such as drainage map
- Expand your Agrinavia MAP with GPS modules
- Measure the areas.
- Present field information
- Print presentable maps
- Edit areas

### Measure the areas

To measure an area you zoom in on your Orto photo so you can see every detail. After zooming in, you draw the field boundary. While drawing the field boundary you can move the map or enlarge it. When the field boundary is complete the program calculates the area of the field.

### Editing areas

When it comes to editing areas, Agrinavia MAP is without comparison. Areas are easily divided by drawing a line from boundary to boundary. You can also parallel shift a boundary with the number of meters you like for example to calculate the area of a 20 meter headland. With a unique function you can get the program to calculate a field division by stating the desired number of hectares.

### Presentation of field data

After having entered the field codes in the fields the program automatically gets information about the fields from your field program, Agrinavia Field. The field map is coloured depending on the type of crop. The program can show a wide range of information from your field plan and field records. For example crop names, names of varieties, fertilizer levels, sowing plan etc.

### Print presentable maps

In Agrinavia MAP the printing function gives you lot of opportunities. You can print either the complete map or part of it. You can also print the map in real scale and choose to place the headlines and comments on the map.

# Agrinavia MAP

## **Expand with more modules**

Build up your Agrinavia MAP with the modules you need when you want to have a complete overview. This is possible both for you with a smaller property or if you work as a consultant.

## **Draw other information's such as a drainage map**

Agrinavia MAP is not just for area and distance calculations. You can also enter data as drains, wells, land lines, weed fields, lanes, etc.

## **Expand map program with GPS modules**

Agrinavia MAP can be extended with AgroSat modules to handle GPS data for example yield maps, analytical maps, EM38 maps, graduated lime requirements maps and more.

## **Take your field map into the field - with Farm Site Mate**

Through a special menu in the program, you can exchange field maps with the program Farm Site Mate at a PDA (pocket computer). This allows you to take your field maps, drainage maps or weed maps into the field, and use GPS to find the exact spot you need. With Farm Site Mate you can also measure for example the drains, that you have established or repaired. When you are back at the office, you can easily transfer your measurements to Agrinavia MAP.

Agrinavia MAP and Farm Site is also the best combination of programs if you want to get started with spot spraying or modulation of for example lime, fertilizer, seeds etc. The plans are made in Agrinavia MAP and then transferred to Farm Site.

## **MODULES IN AGRINAVIA MAP**

- Multiple users
- Multiple farms
- Farm Site Mate
- Analysis /registration of the results from soil samples
- Languages: English, German, Swedish, Danish
